JPMorgan India: Mumbai GCC Financial Report

Nov 1, 2026 · @Kaushal yadav

Executive summary

The Powai campus can add profit if JPMorgan fills the seats and keeps its cost advantage, but its fixed rent means it can also lose money. In my base case it is worth about ₹2,900 crore ($305 million) in today's money over 2026–2038, pays back in 2032 and earns about $89 million a year once full. In a stress case it loses about ₹3,960 crore ($417 million) and has not paid back by 2038.

- **Asia-Pacific is growing fast.** JPMorgan's Asia-Pacific net revenue rose from $7.9 billion in 2023 to $10.7 billion in 2025, about 16% a year. Its India service centre grew revenue about 22% a year to ₹24,924 crore in FY2025.
- **The campus is a large fixed commitment.** JPMorgan's India arm leased about 13 lakh sq ft at ₹300 per sq ft a month, rising 4.5% a year, with a ₹468 crore deposit. My model puts rent at ₹5,751 crore over the first 10 years.
- **It is small for the group but big for India.** The base-case benefit is 0.16% of JPMorgan's 2025 net income, but about a third of the India service centre's FY2025 profit.

My view: the campus is worth the commitment if JPMorgan can fill about half its seats with roles that cost more elsewhere. The base case breaks even at 49% seat occupancy (it assumes 85%) or when 20% of campus roles are new or moved (it assumes 35%). The input with the least room is the cost gap, which can narrow only 15% before the value is gone, so India wage inflation matters more than the rent.

The scenario inputs (occupancy, cost gap, AI effect, wages, fit-out cost) are my assumptions. JPMorgan has not published a business case for the campus.

Project overview

JPMorgan is building what would be Asia's largest global capability centre (GCC) in Powai, Mumbai: about 2 million sq ft for roughly 30,000 people, expected around 2029. A GCC is an in-house centre that does technology and operations work for the bank's global business.

Item	Detail	Source
Campus	About 2 million sq ft, up to 30,000 seats, built in phases, completion expected 2029	People Matters
Developer	Brookfield, investing over ₹9,000 crore (about $1 billion). The article does not name JPMorgan, so I link it to this campus by location, size and timing. This is Brookfield's cost, not JPMorgan's	Realty Today
Lease	J.P. Morgan Services India leased over 13 lakh sq ft at One Forest Avenue, registered 24 Dec 2025	Realty Today
Rent	About ₹39 crore a month at start (₹300 per sq ft), rising 4.5% a year	Realty Today
Deposit and duty	₹468 crore security deposit and ₹125 crore stamp duty	Realty Today
Total rent reported	Over ₹5,200 crore; 20-year lease with a 10-year initial term	Realty Today
People in India	About 55,000 today; about 1,000 technology hires planned	Outlook Business

The lease details I found cover 13 of the 20 lakh sq ft, so the model costs only the 13 lakh and counts seats for that share (19,500). The rest is treated as not yet committed. Other India moves, such as doubling the GIFT City book from about ₹9,500 crore, are not part of this model.

Past performance in Asia and India

Asia-Pacific and India have grown faster than the firm as a whole. In 2025 JPMorgan's net revenue rose 2.8% to $182.4 billion while net income fell 2.4% to $57.0 billion, yet Asia-Pacific revenue rose 20.7% (JPMorgan 2025 MD&A).

Year	Asia-Pacific net revenue ($ million)	Growth	Share of firm revenue
2023	7,891	–	5.0%
2024	8,867	12.4%	5.0%
2025	10,699	20.7%	5.9%

JPMorgan does not report India separately. The best public window is J.P. Morgan Services India, the entity behind the India GCC (Tofler, compiled from company filings):

Fiscal year (March)	Revenue (₹ crore)	Net profit (₹ crore)	Net margin	Staff cost share of revenue
FY2021	11,407	1,151	10.1%	71.5%
FY2022	14,102	1,306	9.3%	72.3%
FY2023	18,380	1,965	10.7%	70.8%
FY2024	21,470	1,998	9.3%	73.9%
FY2025	24,924	2,582	10.4%	73.6%

Revenue grew about 22% a year and profit about 22% a year over FY2021–FY2025, but yearly revenue growth slowed from 30% in FY2023 to 16% in FY2025. Net margin stayed near 10% and staff cost near 72% of revenue. That pattern fits a service entity paid cost-plus by other JPMorgan companies (my inference, not a JPMorgan statement). So the GCC's profit mostly reflects India's cost base, not extra profit for the group.

Two other India signals: J.P. Morgan Securities India, a lending arm, earned ₹265 crore after tax in FY2025, up 12% from ₹237 crore (Boards' Report). Corporate banking revenue in India has grown about 30% a year for two to three years, with about 1,900 clients (Business Standard, Sep 2025).

A third-party site, Bullfincher, shows larger Asia-Pacific revenue ($14.1 billion for 2025). I used JPMorgan's own filing because I could not reconcile the two sources.

How the project can raise profit

The profit comes from doing the same work for less: staffing new or moved roles in Mumbai instead of costlier locations. In the base case, 14,918 people work in the campus by 2033 and 35% of them (5,221) are roles that are new or moved. Each saves about ₹34.6 lakh a year, so savings reach about ₹1,806 crore against ₹698 crore of rent and running costs, a cover of 2.6 times.

- **Lower staff cost.** Average India employee cost was about ₹33 lakh a head in FY2025 (GCC staff cost ₹18,344 crore over 55,000 people; a rough figure). The model assumes the same role costs 1.8 times as much elsewhere.
- **Capacity to grow.** Asia-Pacific revenue rose 20.7% in 2025 and India corporate banking about 30% a year. A single large campus gives room for the roughly 1,000 technology hires planned in cloud, cybersecurity and AI data work.

- **Scale and retention (not modelled).** One site can cost less per seat than scattered leases and help hiring and retention. I left these out because no public figures exist.

Once the campus is full, rent is the same each year apart from the 4.5% step-up, while savings grow with the cost of staff elsewhere. That is why the base case turns positive from the second operating year.

How the project can lead to a loss

The campus loses money when seats sit empty or the cost gap closes, because the rent is owed either way. Over the first 10 years my model has ₹5,751 crore of rent plus about ₹1,440 crore of running costs, ₹585 crore of fit-out and a ₹468 crore deposit tied up. In the stress case savings total only ₹270 crore, so the project loses about ₹3,960 crore in today's money.

- **Fewer people than planned.** Dimon said AI cut staffing needs 30–40% in some functions (Outlook Business). The stress case assumes 60% occupancy and 25% fewer seats needed.
- **The cost gap closes.** If India wages rise 9% a year against 3.5% elsewhere and the rupee stops weakening, the savings per head reach zero by the early 2030s.
- **Delay or overrun.** Fit-out at ₹5,500 per sq ft instead of ₹4,500 adds about ₹130 crore, and a late handover pushes savings back while costs such as the deposit are already paid.
- **Rent terms.** My schedule gives ₹551 crore more rent over 10 years than the ₹5,200 crore reported. The sources do not explain the gap, so the real rent may differ.
- **One-site concentration.** Putting up to 30,000 people in one place raises business-continuity risk. I did not put a number on it.

In the base case, value falls to about zero if only 20% of campus roles are new or moved (instead of 35%), or if the cost gap shrinks from 1.8 times to about 1.5 times. JPMorgan could soften a loss by phasing in or subletting space; the sources do not say whether the lease allows it.

Scenario model in Excel

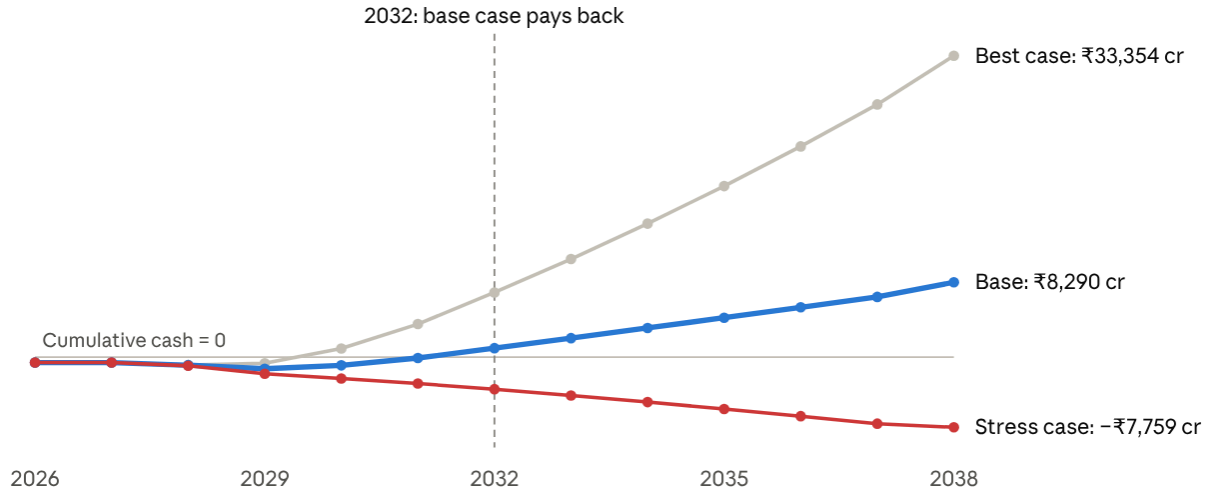

The workbook runs the same formulas for three sets of assumptions from 2026 to 2038, the 10-year initial lease term plus the build years. Value is the net present value (NPV) at a 10% discount rate, with the deposit refunded in 2038 and ₹95 per dollar.

Measure	Base	Best case	Stress case
Seat occupancy	85%	92%	60%
Seats cut by AI	10%	5%	25%
Roles that are new or moved	35%	45%	20%
Cost of same role elsewhere vs India	1.8x	2.1x	1.5x
India wage inflation a year	8.0%	7.5%	9.0%
Fit-out cost (₹ per sq ft)	4,500	4,200	5,500
People in campus at steady state	14,918	17,043	8,775
NPV (₹ crore)	**2,895**	**13,290**	**(3,962)**
NPV ($ million)	**305**	**1,399**	**(417)**
Internal rate of return	35%	75%	n/a
Cash payback year	2032	2030	Not by 2038
Average yearly accounting benefit (₹ crore)	842	3,348	(763)
Operating years with a loss (of 10)	1	0	10

The base case loses money only in 2029, the first year, when the campus is 30% occupied but pays full rent. The best case is optimistic: it needs both a large cost gap and many moved roles. The stress case is a floor, not a forecast: it ignores subletting and assumes JPMorgan stops moving roles once India costs more.

Base case pays back in 2032; the stress case is ₹7,759 crore down by 2038

Cumulative net cash flow of the Powai campus, ₹ crore, by scenario

Source: jpmorgan_india_model.xlsx, sheets Model_Base, Model_Best and Model_Stress; net cash flow summed from 2026, ₹ crore

Break-even points show what you need to believe for the base case to stop adding value, changing one input at a time (Sensitivity sheet, section C):

Input	Base case	Break-even	Room to fall
Seat occupancy	85%	49%	42%
Share of campus roles that are new or moved	35%	20%	42%
Cost of the same role elsewhere vs India	1.80x	1.54x	15%

Occupancy and role share fall by the same 42% because both scale savings in a straight line. The cost gap has far less room, so it is the more fragile assumption.

Average yearly benefit in the base case is about $89 million, 0.16% of JPMorgan's 2025 net income and about 33% of the India GCC's FY2025 net profit. Even the best case ($352 million a year) is 0.6% of group net income.

SQL analysis

The SQL file loads the history and the model's yearly cash flows into six tables and runs eight queries on them. Its net present values match the Excel summary to the rupee crore, which checks that the two tools agree.

Query	What it shows	Result
Asia-Pacific trend	Growth and share of firm revenue	Growth of 12.4% then 20.7%; share up from 5.0% to 5.9%
India GCC trend and growth rates	Revenue, margin, staff cost, return on net worth	Revenue grew 21.6% a year and profit 22.4% a year; return on net worth 13.9% in FY2025
Value by scenario	NPV from the cash-flow table	₹2,895 crore, ₹13,290 crore and ₹(3,962) crore
Payback and cash hole	Year cumulative cash turns positive and its lowest point	Base 2032, lowest ₹(1,283) crore; stress never, lowest ₹(7,759) crore
Savings against rent	Savings divided by rent plus running costs	Base 0.82x in 2029 and 2.59x in 2033; stress 0.09x in 2029, then zero
Scale	Benefit against group and GCC profit	Base 0.16% of JPMorgan net income; best 0.62%; stress (0.14%)
India profit pools	GCC plus lending arm profit	₹2,847 crore in FY2025, up from ₹2,234 crore in FY2024

The queries use window functions and `POWER()`, so they need MySQL 8.0 or later (or SQLite 3.35 or later). The full results are also on the SQL_Results sheet of the workbook.

Conclusion, limits and sources

In my base case the campus pays off if JPMorgan fills most seats with roles that would cost more elsewhere, but it is not a sure gain. Profit depends on four things: occupancy, how far AI shrinks headcount, India wage inflation against the rupee, and the real rent terms. Because the rent is fixed, a shortfall in the first three turns directly into a loss. For JPMorgan as a whole the effect is small either way.

Three signals would show early which way it is heading: how fast seats fill after 2029, India wage inflation against costs elsewhere and the rupee, and how much AI trims headcount per role.

Limits of this analysis

- Scenario inputs are my assumptions, not JPMorgan figures. Change them on the Assumptions sheet of the workbook.

- India GCC history comes from Tofler, not from audited accounts I opened. India headcount is 55,000 in one article and about 60,000 in another.
- The rupee rate (₹95 per dollar) is derived from a conversion in an Outlook Business article and held flat.
- Only the 13 lakh sq ft lease is costed. Rent saved by vacating other offices, productivity, retention, new revenue, tax and transfer pricing are not modelled; crediting the first would improve every case.
